

Naatiq

Voice in. Career out.

A voice-first hiring pipeline for the workers your database cannot see.

Designed and built end to end with Claude Cowork.

Karam Judeh · Rahma Al Sharif · Abderrahim Laghmari

The workforce you cannot search

Domestic workers, drivers, cooks, electricians, salon technicians, delivery riders, security guards.

1

No CV

Ten or more years of real experience, none of it documented anywhere.

2

No digital footprint

Not on LinkedIn, not in a job board, not in your ATS.

3

Found only by referral

Every new job restarts their reputation from zero.

They are not a niche. In Gulf and Levant labour markets they are the majority of hires.

The barrier is format, not skill

What the worker has

- A decade of verifiable, specific experience
- Named employers and real durations
- Concrete skills, tools and achievements
- A smartphone and daily WhatsApp use

What every CV tool demands

- Literacy in formal written language
- A laptop and a keyboard
- Comfort with abstract forms and fields
- Knowing what a CV is supposed to contain

Remove the format requirement and the supply was always there.

What this costs a recruitment business

The candidate's problem is also a margin problem.

Shallow pipelines

High-volume trades are the hardest roles to fill and the thinnest part of your database.

Slow time-to-fill

Sourcing runs on phone calls and personal networks that do not scale.

Unverifiable candidates

No structured history means no shortlist, no comparison, no confidence.

Margin lost to manual work

Consultants spend hours transcribing what a candidate said into something searchable.

WHAT IT IS

A WhatsApp agent that turns a spoken conversation into a structured candidate profile.

No app to install. No form to fill in. No literacy or typing required. The worker speaks in their own dialect; you receive searchable, comparable data and a professional bilingual CV.

Arabic voice

Bilingual output

Zero candidate cost

- 1 Voice note on WhatsApp
- 2 Transcribed in dialect
- 3 Interviewed by AI
- 4 Structured profile
- 5 Bilingual CV returned

Four steps, all inside WhatsApp

Median interaction: a few minutes of speaking, spread over a normal WhatsApp thread.

It works end to end — with a real person, on a real phone

A validated run

- A voice note in Jordanian dialect, transcribed correctly
- Twelve messages of conversation, one question at a time
- Extracted: private driver, three employers, defensive driving and passenger safety, plus a specific achievement
- Correctly inferred fifteen years of experience across three companies
- Bilingual PDF delivered back on WhatsApp in minutes

Nothing was invented.

Every line of the CV traces back to something the worker actually said. The CV writer is explicitly forbidden from adding employers, dates or skills, and falls back to the raw interview if the model omits a field.

Status: validated at pilot scale. Not yet load-tested or proven across all dialects.

What you get: a structured, searchable talent pool

Every conversation becomes a record you can filter, shortlist and compare.

Occupation, normalised

Years of experience

Named employers and durations

Skills and tools

Achievements in their words

Bilingual CV, ready to send

Free-text trades are grouped automatically — "driver", "private driver" and "سائق خاص" resolve to one searchable occupation.

Four things that are harder than they look

Dialect, not textbook Arabic

Workers speak Gulf and Levantine dialect. Transcription and the interview persona are both tuned for it.

Arabic that renders correctly

Right-to-left text whose letters change shape by position. Most PDF tooling gets this visibly wrong; we render through a browser engine.

Truthfulness as a constraint

A padded CV costs a worker their credibility and you your client. Non-fabrication is enforced in the prompt and again in code.

Privacy built into the schema

Public surfaces physically cannot read a full name or phone number — enforced by column grants, not by good intentions.

How it fits your existing operation

Naatiq is an intake layer, not a replacement for your ATS.

Runs serverless. No infrastructure for you to host, and the marginal cost of one profile is a few cents of compute.

Delivery options: hosted portal · data export into your ATS · API access · fully white-labelled

Employers pay. Candidates never do.

This is a commercial decision as much as an ethical one. Charging a worker who has no CV is charging the person with the least ability to pay — and it collapses the supply side that makes the pool valuable in the first place.

Free forever

Candidates: interview, CV, updates and re-issues.

Paid

Employers and agencies: access, tooling, integration and outcomes.

Funded

Programmes and sponsors: reach, cohorts and reporting.

Subscription access to the pool

The recurring core. Predictable revenue, and it compounds as the pool grows.

What the buyer gets

- Search and filter the full candidate pool
- Open and download bilingual CVs
- Request contact through the platform
- Saved searches and alerts for new matching profiles
- Seats for the consultants who need them

Why it fits this market

- Agencies already budget for database and job-board subscriptions
- Value rises every month as more workers join — churn falls as the pool deepens
- Tiering is natural: by seats, by regions, or by number of occupations unlocked
- Sales motion is familiar to their procurement teams

One-time payment per occupation

The entry point. Lets a buyer start without a committee, and creates a natural upgrade path.

How it works

- The buyer unlocks a single occupation — drivers, cooks, electricians
- Full access to every candidate in that category, for a fixed window
- No subscription, no negotiation, no procurement cycle
- Unlocks credit toward an annual plan if they convert

Why it earns its place

- Removes the biggest objection: paying for a pool before seeing it
- Matches how staffing demand actually arrives — one urgent role at a time
- Reveals which occupations a buyer needs, which is the data that prices their renewal
- Works for small employers and families who will never buy a seat licence

Additional revenue streams — commercial

1

Placement success fee

A fee on confirmed hires. Aligns revenue with the outcome the client actually buys.

2

Verification tier

Paid checks on references, documents and prior employers. Sold as a premium badge on the profile.

3

White-label and API

Agencies and job boards embed the intake agent in their own funnel under their own brand.

4

Branded intake funnels

A client's own WhatsApp link; they pay per profile created into their private pool.

5

Database enrichment

Run an agency's existing unstructured candidate records through the agent to standardise them.

6

Sponsored roles

Push an urgent vacancy to matching candidates on the channel they already use.

Additional revenue streams — institutional

Buyers who fund reach rather than access — often larger, slower, and stickier.

Programme licensing

Government skilling and employability programmes pay per beneficiary reached, with reporting built in.

Labour-market analytics

Aggregated, anonymised supply data: which trades exist where, and how that shifts over time.

Sponsored CV cohorts

A corporate funds a number of CVs as measurable social impact, with named reporting.

Compliance packs

Standardised worker records formatted for visa, labour-file and audit processes.

How to price it, without guessing

Deliberately no figures here — these should be set against your own placement economics.

Value metric

- Subscription: seats, or occupations unlocked
- Per-occupation: size and scarcity of the category
- Success fee: share of the placement's value

What it anchors against

- Existing job-board and database spend
- Cost of a consultant's sourcing hours
- Referral fees already being paid

What moves it

- Depth of the pool in that occupation
- Exclusivity and freshness of access
- Verification level and integration depth

Rule of thumb: price against the cost of the hours this removes, not against the cost of running the software.

What we will not monetise

Worth stating explicitly — procurement, ESG and legal will all ask.

No candidate charges, ever

No fees, no premium placement, no pay-to-be-seen. The supply side stays free or the model breaks.

No selling personal data

Analytics products are aggregated and anonymised. Individual records are never the product.

Consent before visibility

A worker opts in explicitly before their profile is visible to employers, and can withdraw.

No exclusivity over a worker

Candidates are never locked to one agency. They keep their CV and can take it anywhere.

Land narrow, expand by occupation and geography

01

Land

One agency, one high-volume occupation, one city. Prove time-to-fill against their current process.

02

Expand

More occupations, more seats, then integration into their ATS. Add the success fee once trust exists.

03

Extend

New languages open new labour corridors. Programme and analytics revenue follows the scale of the pool.

The pool is the moat. Every conversation makes the next sale easier and the product harder to replicate.

What is built, and what is not

Stated plainly, because the gaps are what a partnership would close first.

Working today

- Voice note to bilingual CV, end to end
- Structured profiles with occupations grouped
- Employer portal and live impact dashboard
- Privacy enforced at the database level

Not yet done

- Arabic voice replies — built, behind a paid-plan flag
- Job matching and interview practice
- Private CV storage with signed links
- Languages beyond Arabic; load testing at scale

Every part of this — the agent, the CV engine, the portals, the database and this deck — was designed and built end to end with Claude Cowork.

Voice in. Career out.

Naatiq does not just match people to jobs. It makes more people matchable — and every profile it creates is an asset your competitors cannot search.

What we are asking for

A pilot occupation and city

Access to your placement economics

A named commercial sponsor

Karam Judeh · Rahma Al Sharif · Abderrahim Laghmari
