

Documentation Index

The complete Naatiq documentation set — what each document covers and who it is for

About Naatiq

Naatiq (ناطق) is a voice-first WhatsApp agent that turns an Arabic voice note into a professional bilingual PDF CV, for workers the CV economy excludes — domestic workers, drivers, tradespeople, salon technicians, kitchen staff.

The name means "*articulate*" or "*speaking*". The product was originally called *Wathefti* (وظيفتي); the rename is reflected throughout this set.

The documents

#	Document	Read it if you want to know...
01	Executive Summary	What Naatiq is and why it matters, in two minutes
02	Product Requirements (v2)	Scope, goals, what shipped and what did not
03	Target Audience	Who it serves, which trades, and why WhatsApp voice
04	Technical Documentation	Architecture, data model, request flow, components
05	Product System Prompts	The two production prompts, verbatim, with rationale
06	Building with AI	How it was built, the prompts used, what went wrong
07	Tools and Stack	Every service and library, why chosen, what it costs
08	Security and Privacy	Data held, controls, trade-offs, production checklist
09	Setup and Runbook	Deploying from scratch; diagnosing failures
10	Testing and Limitations	What is proven, how, and everything that is not
11	Demo Script	Two-minute video and five-minute presentation
12	Build Prompt Log	Every instruction given during the build, verbatim and in order

The three prompt documents, distinguished

They are easy to confuse, so: **05** holds the two prompts that run *in production* every time a worker sends a message. **12** holds every prompt the *human* gave to build the system, verbatim. **06** is the narrative that connects them — the method, the turning points and the mistakes.

Suggested reading paths

Judges and reviewers: 01, then 10, then 06 with 12 alongside it. The summary establishes the idea, the testing document shows what is genuinely proven rather than claimed, and the build narrative plus the raw prompt log show exactly how it was made — including the mistakes.

Engineers: 04, then 05, then 09. Architecture, then the prompts that are the actual product, then how to run it.

Anyone assessing risk: 08, then 10. The privacy trade-offs are stated explicitly, as are the untested areas.

Anyone presenting it: 11, with 01 for the framing and 10 for the honest answers to hard questions.

Other artefacts in this repository

- `docs/naatiq-architecture.svg` / `.png` — the system diagram.
- `cv/naatiq-cv-sample.pdf` — a real generated CV.
- `dashboard/index.html` — the live impact dashboard.
- `web/index.html` , `web/employers.html` — landing page and employer portal.

How this documentation is maintained

The Markdown files in `docs/src/` are the **source of truth**. The PDFs in `docs/pdf/` are build artefacts and should never be edited by hand — edit the Markdown and regenerate:

```
pip install markdown weasyprint pillow --break-system-packages
python3 docs/build_docs.py
```
